

## **Git Commands**

### **Git clone:**

To copy an existing remote to store it in our local machine.

### **Git add:**

It uses to track and stage changes in file before doing commit.

### **Git push:**

It is used to upload our local repository to the remote repository (GitHub).

### **Git fetch:**

To download changes from the remote repository without merging them with our branch.

### **Git merge:**

It's used merge changes between branches.

### **Git pull:**

It does both fetch and merge in our branch.

### **Git revert:**

Removing a commit without clearing the history.
